Order Analytics Module

Prepared by: Akib Rahman

Module Description: Core performance indicators, mathematical formulas, business rules, and calculation logic for the **Order Analytics** dashboard.

Technical & Functional Specifications

#	Metric	Definition	Business Logic & Calculation Formula	Example
1	Total Orders	The total number of orders created during the selected date range, regardless of current status.	Calculation Rule: - Filter orders by <code>Order Creation Date</code>. - Count all created orders across all channels (Website, Storefront, Telesales, etc.).	Date Filter: Today - Website Orders = 10 - Telesales Orders = 8 Total Orders = 18

#	Metric	Definition	Business Logic & Calculation Formula	Example
2	Average Order Value (AOV)	The average monetary value per order placed within the selected date range.	Formula: $AOV = \frac{\text{Total Revenue}}{\text{Total Orders}}$ Calculation Rule: - Filter valid/completed orders based on business criteria. - Sum total order revenue and divide by total order count.	Date Filter: Today - Total Revenue = ₹18,000 - Total Orders = 18 - AOV = ₹1,000
3	Completed Orders	The total number of orders whose current status is Completed within the selected date range.	Calculation Rule: - Filter orders by Order Creation Date . - Count only orders where current status = Completed .	Date Filter: Today - Total Orders = 18 - Completed Orders = 6
4	Not Completed Orders	The total number of orders that have not yet reached Completed status (includes Pending , Confirmed , Processing , Cancelled , Returned , etc.).	Formula: $\text{Not Completed} = \text{Total Orders} - \text{Completed}$  (or count all orders where status $\neq$ Completed)	Date Filter: Today - Total Orders = 18 - Completed Orders = 6 - Not Completed Orders = 12
5	Average First Response	The average time taken by the operations/support team to record the first response after an order is created.	Formula: $\text{Avg First Response} = \frac{\sum (\text{First Response Time})}{\text{Total Responses}}$  Calculation Rule: Calculate time difference per order, sum total duration, and divide by total responded orders.	Response Times: - Order 1 = 3 min - Order 2 = 5 min - Order 3 = 7 min - Average = 5 minutes

Charts & Visualizations

Visualization Specifications

#	Chart Name	Definition & Business Logic	Calculation & Prefix Rules	Example
1	New vs Return Customers	Displays customer distribution based on order history. • New Customer: First order placed. • Returning Customer: Has ≥ 1 previous order.	Calculation Rule: 1. Filter orders by Order Creation Date . 2. Evaluate customer order history. 3. Compute count and percentage allocation.	Date Filter: Today (<i>Total</i> = 12) • New Customers = 5 (41.7%) • Returning Customers = 7 (58.3%)
2	Orders by Mobile Carrier	Groups orders based on the customer's telecommunication operator identified via phone prefix.	Prefix Rules (BD Carriers): • 017 , 013 → Grameenphone (GP) • 018 , 016 → Robi / Airtel • 019 , 014 → Banglalink • 015 → Teletalk	Sample Distribution: • GP (017***): 7 (38.9%) • Teletalk (015***): 5 (27.8%) • Banglalink (019***): 3 (16.7%) • Robi (016***): 2 (11.1%) • Airtel (018***): 1 (5.6%) • Other: 0 (0.0%)
3	Orders by Shipping Zone	Categorizes and displays order distribution across defined delivery geographic zones.	Zone Categories: • Inside Dhaka • Sub Dhaka • Outside Dhaka Counts orders per zone and calculates overall volume percentages.	Sample Distribution: • Inside Dhaka = 13 (72.2%) • Sub Dhaka = 4 (22.2%) • Outside Dhaka = 1 (5.6%)

#	Chart Name	Definition & Business Logic	Calculation & Prefix Rules	Example
4	Orders by Source	Displays order volume grouped by incoming sales channel / platform.	Calculation Rule: 1. Read Order Source attribute. 2. Group by channel (Storefront , Telesales , Website , Mobile App , etc.). 3. Output volume count and percentage breakdown.	Sample Distribution: • Telesales = 13 (72.2%) • Storefront = 5 (27.8%)
