

Order Analytics

Reports Module - Order Analytics Dashboard

Metrics:

Metric	Definition	Business Logic / Calculation Rule	Example
Total Orders	The total number of orders created during the selected date range, regardless of their current status.	Calculation Rule: - Filter orders using the Order Creation Date. - Count every order created within the selected date range. - Includes orders from all sources (Website, Storefront, Telesales, etc.).	Filter Date: Today Website Orders = 10 Telesales Orders = 8 Total Orders = 18
Average Order Value	The average monetary value of each order placed during the selected date range. It helps measure how much customers spend per order.	Formula: AOV = Total Revenue ÷ Total Orders - Filter completed or valid orders (based on business rule). - Sum the total order value. - Divide by the total number of orders.	Filter Date: Today Total Revenue = ₺18,000 Total Orders = 18 AOV = ₺1,000

Completed Orders	The total number of orders whose current status is Completed within the selected date range.	Calculation Rule: - Filter orders by Order Creation Date. - Count only orders whose current status is Completed.	Filter Date: Today Total Orders = 18 Completed Orders = 6 Completed Orders = 6
Not Completed Orders	The total number of orders that have not yet reached the Completed status. This includes Pending, Confirmed, Processing, Cancelled, Returned, or any other non-completed status depending on the business rules.	Formula: Not Completed Orders = Total Orders – Completed Orders or Count all orders whose current status is not Completed.	Filter Date: Today Total Orders = 18 Completed Orders = 6 Not Completed Orders = 12
Average First Response	The average time taken by the support or operations team to provide the first response after an order is created. This measures the team's responsiveness.	Formula: Average First Response = $\Sigma(\text{First Response Time} - \text{Order Creation Time}) \div \text{Number of Responded Orders}$ Calculate the response time for each order.	Example: Order 1 = 3 min Order 2 = 5 min Order 3 = 7 min Average = $(3 + 5 + 7) \div 3 =$ 5 minutes

Charts:

Chart	Definition / Business Logic	Example
New vs Return Customers	Displays the distribution of new and returning customers within the selected date range. A New Customer is someone placing their first order. A Returning Customer is someone who has placed at least one order before. Calculation Rule: • Filter orders by Order Creation Date. • Check customer's order history. • If previous order exists → Return Customer. • Otherwise → New Customer. • Display count and percentage.	Filter Date: Today Total Customers = 12 New Customers = 5 (41.7%) Returning Customers = 7 (58.3%)
Orders by Mobile Carrier	Displays the number of orders grouped by the customer's mobile operator. Calculation Rule: • Read customer's phone number. • Identify carrier using the phone prefix.	017*** = GP → 7 (38.9%) 015*** = Teletalk → 5 (27.8%) 019*** = Banglalink → 3 (16.7%) 016*** = Robi → (11.1%)

	• Group orders by carrier. • Display count and percentage for each carrier.	018*** = Airtel → 1 (5.6%) Other = 0
Orders by Shipping Zone	Displays the distribution of orders based on delivery location. Calculation Rule: • Read the shipping address. • Categorize into Inside Dhaka, Sub Dhaka, or Outside Dhaka. • Count orders in each zone. • Display count and percentage.	Inside Dhaka = 13 (72.2%) Sub Dhaka = 4 (22.2%) Outside Dhaka = 1 (5.6%)
Orders by Source	Displays the number of orders received from each sales channel. Calculation Rule: • Read the Order Source field. • Group orders by source (Storefront, Telesales, Website, Mobile App, etc.). • Count orders for each source.	Storefront = 5 (27.8%) Telesales = 13 (72.2%)
